```

Problem 2

2 Dice have to equal 6

```
n=1000;
sum=0;
result = numeric(n)
for (i in 1:n){
    x1=sample(1:6,1,replace=T);
    x2=sample(1:6,1,replace=T);
    x=x1+x2;
    if (x==6){a=1} else{a=0}; sum=sum+a;
    result[i]=sum/i;}
mean(result)
```

```
## [1] 0.1515779
plot(1:1000, result)
```

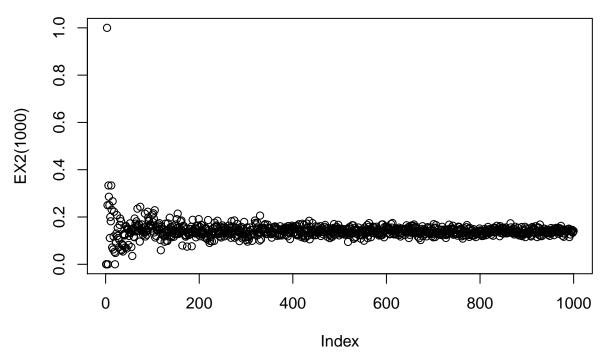

Create a function to compute average number of the events "sum equals 6".

```
EX2 = function (n)
{u=numeric(n);
for(i in 1:n){
    # Outcome (number of 6) of the first die among i rolls.
    X1=sample(1:6,i,replace=TRUE)[1:i];
    # Outcome (number of 6) of the second die among i rolls.
    X2=sample(1:6,i,replace=TRUE)[1:i];
    # Number of the events "sum equals 6" over the total number of rolls i.
    u[i]=sum((X1+X2)==6)/i]; u}
```

Use figure to illustrate the law of large numbers.

```
plot(EX2(1000))
```

Problem 3

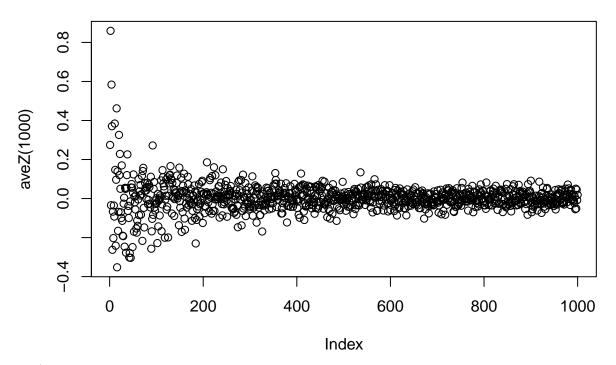

Median, mean and is the variance of the mean or median lower

```
a)
n=5
rnorm(n)
```

[1] -0.4203260 1.1411076 -0.1236702 -1.5450058 -0.3237903

b) Plot the sequence to illustrate the law of large numbers.

```
aveZ = function (n){
    m=numeric(n);for(i in 1:n){m[i]=mean(rnorm(i))
    }
    m
}
plot(aveZ(1000))
```

c) Variance of the mean is lower than the variance of the median

```
Mean:
```

```
n=1000
b=0
for (i in 1:n){
  a=median(rnorm(100));
  b=b+a;
mean1=b/n;
mean1
## [1] 0.00326291
Median:
n=1000
for (i in 1:n){
  a[i]=median(rnorm(100));
  v=var(a);};
## [1] 0.01563109
n=1000
for (i in 1:n){
  a[i]=mean(rnorm(100));
  v2=var(a));
v2
```

Problem 4

Linear Regression and prediction

A Walmart supermarket has 15 cashiers (but they are not all in service). The table below describes the

corresponding customer average waiting time VS the number of cashiers in service.

```
cashiers=c(3, 4, 5, 6, 8, 10, 12);
wtime=c(16, 12, 9.6, 7.9, 6, 4.7, 4);
lm.fit=lm(wtime~cashiers);
summary(lm.fit);
##
## Call:
## lm(formula = wtime ~ cashiers)
